EDUCATION

2019-2025

FACULTY OF COMPUTER SCIENCE
AND ENGINEERING

- Bachelor's degree in Computer Science

SKILLS

- Java
- C#
- ReactJS
- AngularJS
- Declarative UI
- Containerization(Docker)
- Spring Framework
- .NET
- Microservices
- Alfresco Content Services
- Golang
- GraphQL
- CI/CD(GitHub Actions, Gitlab CI)
- Kubernetes
- Playwright/XUnit

LANGUAGES

- English: Fluent
- Macedonian: Fluent
- German: Basics

PROFILE SUMMARY

A dedicated and ambitious full-stack software engineer with a strong foundation in Java Spring and Spring Boot, complemented by expertise in modern frontend frameworks such as ReactJS and AngularJS. I have hands-on experience building enterprise-grade solutions for digital banking environments, including working on a digital pricing application within a digital banking department, where I contributed to pricing logic, rule-based configurations, and scalable backend services. With a background in Document Management Systems (DMS) and Enterprise Resource Planning (ERP) platforms, I specialize in developing secure, high-performance systems that support financial products, transactions, and regulatory workflows.

WORK EXPERIENCE

ASEE

SEPTEMBER 2025--PRESENT

Software Engineer

- I worked on a digital pricing application in a banking environment that enables customers to calculate transaction fees and apply configurable benefit options across financial products.
- As a full-stack developer, I contributed extensively to both an event-driven backend architecture and the user interface, ensuring accuracy, scalability, and a seamless user experience. I also supported the solution with DevOps practices for development and deployment workflows, and collaborated closely with QA processes to ensure reliability and correctness in financial calculations.
- Accomplishments include:
 - Designed and implemented approval and deactivation workflows using an event-driven architecture and BPM processes with C# and .NET, supporting controlled and auditable financial operations.
 - Developed user interface screens using AngularJS and Declarative UI, closely following established UX design guidelines to ensure consistency and usability.
 - Configured and maintained Kubernetes-based deployment pipelines, enabling reliable and repeatable application deployments across environments.
 - Implemented end-to-end (E2E) automated tests using Playwright and xUnit, ensuring correctness, stability, and confidence in critical pricing and approval flows.

Inteligenta

JULY 2022-JANUARY 2025

Software Engineer

- I have contributed to a range of enterprise and fintech-oriented projects, including Document Management Systems (DMS), platforms integrating Know Your Customer (KYC) and Anti-Money Laundering (AML) capabilities, and Enterprise Resource Planning (ERP) systems.
- As a full-stack developer, I have worked extensively across both backend and frontend engineering, with additional exposure to DevOps practices supporting development, deployment, and system stability.
- Accomplishments include:
 - Implemented document management functionalities using Alfresco and AngularJS, supporting secure storage, retrieval, and lifecycle management of documents.
 - Developed frontend applications using AngularJS and ReactJS, delivering responsive and user-centric interfaces.
 - Implemented KYC and AML workflows, contributing to compliance with financial and regulatory requirements.
 - Designed and built RESTful backend APIs using the Spring Boot framework, enabling reliable integration between services and frontend applications.

PERSONAL PROJECTS

- MK Malware Tracker
 - MK Malware Tracker is a malware monitoring and tracking platform designed to identify and analyze malicious activity distributed across computers, servers, and IoT devices within North Macedonia. The application is built using Java Spring Boot for the backend and React for the frontend.
 - I contributed to both backend and frontend development, designing and implementing RESTful APIs, building the UI architecture, and integrating backend endpoints with React components. The system was deployed to a Microsoft Azure VM, configured with NGINX, and exposed via a public domain, ensuring availability and reliability.
- Project Scrape
 - A first-person arena shooter developed using the Godot 4 game engine, where I worked on core gameplay mechanics, game logic, and original music composition, contributing to both the technical and creative aspects of the project.
- Scrape backend
 - A backend system for a promotional web platform that allows users to register, authenticate, and manage blog posts and bug reports. The service is implemented in Golang and includes GraphQL-based API integration with Linear, enabling structured issue tracking and workflow management.
